## I N T R O D U C T I O N

This report contains a brief, concise summary of traffic patterns at each permanent traffic counter that was in operation during the year 1981. The traffic volumes for each month and day of the week are compared to average daily traffic for the year. A total of 46 automatic traffic counters were in operation during 1981. Four new counters were added during the year bringing the total to 50 counters in operation.

At each recorder the highest, the 10th, the 20th, the 30th, and the 40th and the 50th highest hours that occurred during each year are shown as a computed percentage figure of the average daily traffic. These are compared to the previous ten years and 1941 and 1961 as to stability and accuracy.

The 50 counters are distributed to the Highway System as follows:

|                        |                                |
|------------------------|--------------------------------|
| 10 on Interstate Rural | 4 on Secondary System          |
| 23 on Primary Rural    | 4 on FAU System                |
| 3 on Primary Urban     | 3 on Interstate Frontage Roads |
| 1 on Local Road        | 2 on Recreational Roads        |

### 30TH. MAXIMUM HOUR

The American Association of Highway Officials decided it was not practical to design for the average daily traffic or the highest traffic that occurs during the year. If highways are designed for the average daily traffic, there would be times when the movement of vehicles would surge far above the average. If designed for the highest traffic volume, such conditions would occur only once or twice a year. Upon thorough investigation, it was agreed that the 30th. highest hour would be a feasible traffic volume for design purposes. This particular hour is known as the Design Hour Volume, or the 30th. maximum hour, and was to be used as the criterion for the design of the "National System of Interstate Highways". It is also now used in the design of Primary and Secondary Highways in Montana.
